

Terraform project

```
command line argument to provide a value for this variable.
voldemort@voldemort-Lenovo-Legion-5-15ARH05H:~/ITI-DevOps/Terraform/Terraform-project$ terraform workspace new dev
Created and switched to workspace "dev"!

You're now on a new, empty workspace. Workspaces isolate their state,
so if you run "terraform plan" Terraform will not see any existing state
for this configuration.
voldemort@voldemort-Lenovo-Legion-5-15ARH05H:~/ITI-DevOps/Terraform/Terraform-project$ terraform workspace select
dev
voldemort@voldemort-Lenovo-Legion-5-15ARH05H:~/ITI-DevOps/Terraform/Terraform-project$ terraform workspace list
default
* dev
voldemort@voldemort-Lenovo-Legion-5-15ARH05H:~/ITI-DevOps/Terraform/Terraform-project$
```

Listeners and rules (1) Info

Manage rules

Manage listener

Add listener

A listener checks for connection requests on its configured protocol and port. Traffic received by the listener is routed according to the default action and any additional rules.

Objects are the fundamental entities stored in Amazon S3. You can use [Amazon S3 Inventory](#) to get a list of all objects in your bucket. For others to access your objects, you'll need to explicitly grant them permissions. [Learn more](#)
